

Photolysis of H_2O_2 in Alkaline Media

SOV/76-33-8-22/39

range of pH 6.0 - 11.2 the photolysis rate of (I) does not depend on the pH. It was found that no ions or ion radicals were formed. The acceleration of the thermal decomposition of (I) (at 40°), which comes about as the OH-ion concentration rises, is considered due to a weakening of the O-O peroxide bond (Ref 7) and the acceleration of the thermal radical decomposition of (I). The stabilizing effect of H^+ -ions in the thermal and photochemical (I)-decomposition is explained by the formation of resistant perhydroxonium ions $[H_3O_2]^{+}$. There are 7 references, 3 of which are Soviet.

TITLE:

Electrical Conductivity of MnO_2^{11} Semiconductors in the
Course of CO Oxidation

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 3,
pp. 648 - 650

TEXT: The authors attempted to find out whether the electron properties of a semiconductor catalyst undergo any changes during reaction processes. The study was conducted on the catalysis of CO oxidation by means of MnO_2 . A continuous-operation apparatus was used for the purpose. The resulting CO_2 was frozen out, and the electrical conductivity of MnO_2 was measured during the process of catalysis. The measurement of the Hall effect and thermo-emf made by T. I. Kolomenskaya at the Fizicheskiy institut AN SSSR (Institute of Physics of the AS USSR) showed that MnO_2 is an n-type semiconductor. Two stages were distinguished in the training of the catalyst. The catalytic activity is low at the beginning, but

AUTHOR: Purmal', A. P. and Frost, A. V. (Deceased)

TITLE: Dissociation energy of OH

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya 2, khimiya
no. 1, 1961, 25 - 33

TEXT: The importance of the hydroxyl group for oxidations requires the precise knowledge of its dissociation energy. The values for ΔH of the reaction $H_2O \rightleftharpoons 1/2 H_2 + OH$ determined by O. Oldenberg and R. I. Dwyer

(Ref. 2: J. Chem. Phys., 12, 351, 1944) differed by 4000 cal from the values obtained by B. Lewis and G. Elbe (Ref. 3: J. Chem. Phys., 3, 63, 1935). The authors measured the hydroxyl concentration in water-oxygen mixtures at various temperatures in order to obtain more precise values of $E_D(OH)$. The spectroscopic line absorption method worked out by

V. N. Kondrat'yev served for the determination of relative hydroxyl concentrations. A discharge tube with 300 watt and 150 ma served as source of light. Water-hydrogen mixtures differing according to the

Card 1/7

S/189/61/000/001/001/002

B110/B208

Dissociation energy of OH

thermostat temperature came from a diffuser with thermostat via a glass tube heated up to 150° C at a rate of 2-6 l/hr into an absorption tube of cast heatproof and gastight porcelain of 1 m length (30 mm in diameter) (reaction temperature = 1350° C; on overheating = 1450° C). A furnace RO-05 of the Siemens Plania Werke was used. The temperature was kept constant at 1250° C ± 1° C by means of a thermoregulator and measured in the absorption tube by Pt-PtRh-thermocouple. Furthermore were used: the automatic quartz glass spectograph KC -55 (KS-55), dispersion in the range of 3000 Å: 4.6 Å/mm, resolving power in the range of 3000 Å: 22000, effective relative aperture for $\lambda = 3000 \text{ Å}$: 1/38, apertural width for recording: 0.025 - 0.03 mm, photographic plates "Spektral'nye nikfi", type II, III, and the recording Zeiss microdensitometer. The temperature dependence of the absorption coefficients (Table 2) of individual lines of the bands OH 3064 Å (0', 0") for optimal mixtures ($2/3 \text{ H}_2\text{O} + 1/3 \text{ O}_2$) was investigated according to V. N. Kondrat'yev. The thermal effect of the reaction $2 \text{ H}_2\text{O} + \text{O}_2 \rightleftharpoons 4 \text{ OH}$ is the following one:

Card 2/7

23558

S/189/61/000/001/001/002

B110/B208

Dissociation energy of OH

$\Delta H_T = [(4RT_1 T_2) / (T_1 - T_2)] \ln(\mu l_1 / \mu l_2) \cdot \left[\int_0^1 \gamma(I'', T_2) \right] / \left[\int_0^1 \gamma(I'', T_1) \right]$

μl_1 and μl_2 is the effective absorption on a given wave length through the whole gas layer. The following spectroscopic constants were used:
 $A_0 = -140.25 \text{ cm}^{-1}$, $B_1^* = 16.6 \text{ cm}^{-1}$, $B_2^* = 20.57 \text{ cm}^{-1}$, $D_1^* = 0.0129 \text{ cm}^{-1}$,
 $D_2^* = 0.0237 \text{ cm}^{-1}$, $\omega = 3734.9 \text{ cm}^{-1}$, $\Omega = 3/2$. The calculation of the change in the absorption line width was carried out according to (Ref. 16: G. Dejardin et al.: cahiers phys. 46, 3, 1953), that of the change of P_{OH} according to the term $\exp \left\{ -[\Delta H_T(T-T_i)] / (4RT \cdot T_i) \right\}$, T being the furnace temperature and T_i temperature in the given point of the absorption layer. On the strength of the data of light absorption ($Q_1 9/2$, $Q_1 13/2$, $R_2 5/2$, $R_2 7/2$) of the bands 3064 \AA ($0''$, $0'$) ΔH was found to be $148 \pm 2 \text{ kcal}$

Card 3/7

X

Dissociation energy of OH

(Table 3). Weaker lines: Q_2^1 9/2 (2824.375 Å), Q_2^1 11/2 (2826.654 Å), Q_2^1 17/2 (2835.511 Å), Q_1^1 13/2 (2833.822 Å) of the bands 2811 Å (1¹, 0") had to be studied in order to carry out measurements at higher temperatures, i. e. at higher OH concentrations, and to avoid inaccuracies. Greater line intensities at optimal water-oxygen mixture were obtained here only above 1400°K. In order to avoid the temperature error, the temperature measuring range was extended. Temperatures were determined according to O. Oldenberg, at which different $H_2O + O_2$ mixtures ($v = [2 \cdot P_{H_2O} / (P_{H_2O} + 2P_{O_2})] \leq 1$) displayed the same light absorption. The lines Q_1^1 9/2 and Q_1^1 13/2 of the bands 3064 Å of mixtures with $v = 1$ and $v = 0.03504$ were compared. ΔH_T was found to be 147.9 ± 2.3 kcal according to Table 5. The mean value of all three determinations was $\Delta H_T = 147.7 \pm 3$ kcal, in contrast to the value of 157.5 ± 2.6 kcal determined by O. Oldenberg and R. I. Dwyer. These scientists did perhaps not take into account the change in the

B110/B208

"specific weight" of the external temperature zone of the furnace. B. Lewis and G. Elbe obtained in the study of a H_2 , O_2 , He mixture low values by thermal losses. $E_D(OH) = 102.8 \pm 0.8$ kcal was obtained for the dissociation energy from the authors' values. The values obtained by J. R. Bates, T. Z. Tanaka, Koana, and G. A. Hornbeck by extrapolation of the oscillating level energy of the OH molecule are inaccurate. A. G. Geidon (Ref. 25: Dissociation Energy and Spectra of Diatomic Molecules 2d. ed. London 1952) gave for $E_D(OH) = 103 \pm 4.5$ kcal/mole. R. F. Barrow obtained the value $E_D(OH) = 101.36 \pm 0.3$ kcal/mole from the study of the bands of the system $B^2\Sigma^+ - A^2\Sigma^+$ in the hydroxyl spectrum. V. A. Medvedev, V. V. Korobov and V. F. Baybuz determined by means of adiabatic explosion of moistened water-hydrogen mixtures at relatively low thermal losses: $E_D(OH) = 102.2 \pm 1$ kcal/mole. The authors used

$$(\mu l)_T K(2l''+1)$$

$$\mu_0 = \frac{-i(P_{OH})_T}{Q_{sp} \cdot Q_{kaz}} \int_0^\infty (2l''+1) \exp\left\{-\frac{hc}{kT} F(l'')\right\} \exp\left\{-\frac{\Delta H_T(T-T_l)}{4RT T_l}\right\} (3) \quad (Q_{sp} = Q_{rot}, Q_{Kaz} = Q_{cal})$$

Dissociation energy of OH

for the calculation of the light absorption coefficient of an OH molecule at the wave length λ . The absolute OH concentration can be calculated by M_0 . The factors of the intensity i for the lines of the 3064 Å - bands are given in Ref. 1: (V. N. Kondrat'yev: Svobodnyy gidroksil, (The free hydroxyl), GONTI M. - L. 1939). The i -values for the lines of the bands 2811 Å were calculated according to Ref. 28 (L. T. Earls: Phys. Rev., 48, 423, 1935). The $(P_{OH})_T$ -values were calculated from the corresponding equilibrium constants of $H_2O + 1/2 O_2 \rightleftharpoons 2 OH$. The calculated i_0 -values are given in Table 6. The authors thank V. M. Gryaznov for cooperation. There are 6 tables, and 28 references: 4 Soviet-bloc and 24 non-Soviet-bloc. The references to English-language publications read as follows: Ref. 4: Edse R. Third Sympos. on Combust. Baltimore, 1949, p. 611. Ref. 13: Hornbeck, G. A., Fifth Sympos. on Combust., 1955, p. 790. TITLE: A method of determining the depolarising properties of activated charcoal and organic depolarisers and equipment for carrying out the method

PERIODICAL: Referativnyy zhurnal, Elektrotehnika i energetika, no. 21, 1962, 12, abstract 21 A 72 P. (Polish pat. cl. 2lb, 6/02, no. 45371, February 20, 1962) B

TEXT: The depolarising properties of activated charcoal or organic depolarisers are determined by discharge through a test cell in which the depolariser is maintained under constant pressure. The duration of discharge of a certain current to a certain voltage is a measure of the depolarising capacity of the given depolariser. The test cell consists of a carbon cathode, depolariser, filter paper and zinc anode. The cell is located in a tube of electrical insulating material and the depolariser is maintained under constant pressure by a spring fixed in the upper part of the tube.

TOPIC TAGS:	polyvinyl alcohol, tetracycline, erythromycin, antibiotic			
ABSTRACT:	In preparing antibiotic solutions with a polyvinyl alcohol base, antibiotics were added on the basis of 10,000 units/ml to a 10% polyvinyl alcohol solution. It was established that antibiotic activity in a polyvinyl alcohol solution lasted 2 to 4 times longer than in aqueous solutions. Polyvinyl alcohol solutions did not cause irritations of eye tissues. Following the administration of tetracycline hydrochloride (aqueous solution and polyvinyl alcohol solution) in experiments on 44 rabbits, a higher content of the antibiotic was found in the conjunctival sac with a polyvinyl alcohol solution than with an aqueous solution or antibiotic in the form of an ointment. Similar

results were established in determining tetracycline hydrochloride levels in conjunctival cavity lavages and conjunctival cell scrapings; and, also with the use of other antibiotic solutions (erythromycin ascorbate and erythromycin). Treatment (1% solution of tetracycline hydrochloride embedded 2 to 3 times daily) of 104 trachoma patients (adults and children) produced good results. Mean number of bed days was 57.1%. Treatment (1% polyvinyl alcohol solution of erythromycin was imbedded once daily) for 6 mos. prevented any recurrence of trachoma cases during a one year observation period. N. S. TITLE: A study of the optical properties of molybdenum trioxide MoO_3

PERIODICAL: Referativnyy zhurnal, Fizika, no. 6, 1962, 32, abstract 6v214
("Tr. Tbilissk. un-ta", 1960, v. 86, 439 - 448, English summary)

TEXT: A quantitative investigation has been conducted on absorption and reflection spectra of single crystals and polycrystalline MoO_3 films at temperatures between 90 and 465°K. The spectral coefficient of MoO_3 self-absorption displays a steep rise at $\sim 350 \text{ m}\mu$. This absorption edge is displaced, in films, toward the longwave side as compared with single crystals, and shifts toward the side of long waves during heating. In crystals subjected to X- and γ -irradiation and neutron bombardment in the reactor, the spectrum displays an additional absorption band at $350 \text{ m}\mu$, which is unstable and decays under the action of light, and also a stable band at $\sim 900 \text{ m}\mu$ (with neutron bombardment). The $350\text{-m}\mu$ band refers to a center consisting of an oxygen vacancy by which an electron has been ✓✓

TITLE: On the photoconductivity of single crystals of molybdenum
trioxide MoO_3

PERIODICAL: Referativnyy zhurnal, Fizika, no. 6, 1962, 38, abstract 6E306
("Tr. Tbilissk. un-ta", 1960, 86, 449 - 456; English summary)

TEXT: The photoconductivity of MoO_3 single crystals, obtained by a
single, or multiple distillation of MoO_3 powder, and also of films of
this compound, obtained by evaporation in vacuum on a quartz backing, was
investigated. The experiments were carried out with non-irradiated
crystals, and also with crystals irradiated by X-rays, gamma-rays, and
neutrons. The region of photosensitivity of the crystals lies below $360 \mu\text{m}$
and coincides with the region of strong absorption. The photosensitivity
has a maximum at room temperature and is at the maximum in the average
20 - 30%. At temperatures above 70°C the photosensitivity disappears

Card 1/2

On the photosensitivity of ...

irreversibly. With time, a recovery of the photosensitivity takes place, which can be accelerated by annealing. Irradiation of the crystals with X-rays does not change their photosensitivity. Irradiation with gamma-rays effects a small increase of photosensitivity, and irradiation by neutrons - a loss. The photosensitivity is absent in thin films. The obtained results are explained by the presence of oxygen vacancies in the crystals, which are able to capture one or two electrons.

eases of the eye with PAS (Russian text) VESTN. OFTAL.
1956. 6 (41)

Sixty-four patients with phlyctena, of these 24 with superficial and 6 with deep
keratitis, were treated with PAS. The treatment was topical; by instillation of
drops, 4 to 5 times daily of a 2.8% solution of PAS and tablets per mouth. The
majority of the patients were cured within 6 to 12 days. The phlyctena and corneal
infiltrates absorbed and the visual acuity was restored to normal. During the 2 yr.
of observation, recurrence was much rarer than with other methods of treatment.

TITLE: Effect of the waveguide system on the frequency of a maser

CITED SOURCE: Tr. uchebn. in-tov svayzi. M-vo svyazi SSSR, vyp. 19, 1964, 74-87

TOPIC TAGS: maser, maser frequency, maser frequency stability

TRANSLATION: The effect of the waveguide system on the maser frequency stability is analyzed theoretically. An equation of maser oscillations is set up and solved. It is proven that, in order to improve the frequency stability of a maser used as a frequency standard, ferrite valves should be used for decoupling between the maser and the load represented by a detector. A variation of the detector reactance caused by external factors may result in an intolerable variation of the frequency. It is demonstrated that, with a Q-factor of 10^7 , a coupling factor of 0.1, and a detector-reflection-factor modulus of 0.05–0.1, the relative frequency variation is about 10^{-9} tgg (φ is the phase angle of the reflection factor). A method of

Card 1/2

L 62260-65

ACCESSION NR: AR5004632

O

maser tuning by double modulation is suggested: (1) a modulation of the radiation line width and (2) a modulation of the load reflection factor. In the second case, the modulation is performed by the bias current of the detector. The maser output signal is then 4 M. After the signal amplification and conversion, the modulation components can be filtered and applied to frequency detectors.

TITLE: Characteristic of error distributions in telephone channels during discrete signal transmission

SOURCE: Elektrosvyaz', no. 6, 1965, 31-41

TOPIC TAGS: telephone, radio relay, signal distortion equipment

ABSTRACT: After outlining the procedures for communication channel testing, this comprehensive article discusses the faithfulness of discrete information transmission through telephone cable and stationary radio-relay channels, the error distributions in time, the distribution of error groups, the combination distortion probability distribution, and the distribution of the quantity of errors within distorted combinations. Results show that 1) errors are distributed and tend, as a rule, to appear in groups; 2) the average reception error probability is a variable quantity and cannot be used for a reliable estimate of the transmission methods and of the correcting codes; 3) within distorted combinations the errors in cables and radio-relay channels are distributed approximately in the same manner (in spite of different values for the combination distortion probabilities); 4) during the phase difference operation the prevalent number of errors is even; and 5) interventions by the operating personnel are one of the reasons for the decrease in

faithfulness of discrete information transmission. V. I. Shlyapooberskiy, V. Ye.

TITLE: A Good Start (Khorosheye nachalo)

PERIODICAL: Vestnik Vozdushnogo Flota, 1957, Vol. 40, Nr 9,
pp. 86-87 (USSR)

ABSTRACT: A critical review of the scientific-popular 120 page book, published in 1957 by the Military Publishing House, Moscow, entitled "The Master of the Aircraft" (Khozyain samoleta), by P. A. Tokarev, an aeronautical engineer. The book deals with the trade of the aircraft technician or mechanic, describing mainly his role in the various stages of the pre-flight preparation of the aircraft. The reviewer found greatly interesting the part with passages relative to the work carried out by the technicians and mechanics in the front zone during the Great Patriotic War, such as that which enabled a downed aircraft to take off, after doing a heroic emergency repair in no man's land, and fly to safety. The book concentrates too exclusively,

Card 1/2

A Good Start. (Cont.)

86-9-32/36

states the reviewer, on the poor work which the technicians or mechanics should not do. Often, it deals with long-past events. It also contains some inaccuracies. The Soviet popular literature experiences an urgent need of publications on the laborious, creative endeavors of the aeronautical mechanics, technicians, and engineers; the reviewed book is a happy start in the right direction.

TITLE: On the Problem of Generation of Millimicrosecond Pulses
By Means of Travelling Wave Tubes (K voprosu vozobuzhdeniya
nanosekundnykh impul'sov pri pomoshchi generatornoy LBV)PERIODICAL: Radiotekhnika i Elektronika, 1958, Vol 3, Nr 11,
pp 1404 - 1405 (USSR)ABSTRACT: The possibility of generating very short pulses by means
of travelling wave tubes with an internal feedback is
indirectly indicated by the experimental data contained in
a number of published works (Refs 2,3,4). From those
data, it can be concluded that it is possible to generate
oscillations of various types and that to each type of
oscillation corresponds a definite interval of the
accelerating potential. The possibility of obtaining
a milli-microsecond pulse is indicated in the graph of
Figure 1 which gives the wavelength as a function of the
accelerating voltage; if the voltage is changed stepwise
to a value higher than V_2 , the tube will oscillate during
